Food Delivery System

1. Possible Classes and Their Purposes

#	Class Name	Purpose
1	**Customer**	Manages customer information and food orders.
2	**Restaurant**	Manages restaurant details and availability.
3	**FoodItem**	Stores food names, prices, and descriptions.
4	**Menu**	Manages all food items offered by a restaurant.
5	**Cart**	Stores food items selected by the customer before ordering.
6	**Order**	Manages order details, items, and total amount.
7	**Payment**	Handles payments for food orders.
8	**DeliveryRider**	Stores rider information and manages delivery assignments.
9	**Delivery**	Manages delivery details and tracks delivery status.
10	**Admin**	Manages users, restaurants, and overall system operations.

---

2. Three Most Important Classes of the Food Delivery System: Attributes and Methods

---

3. Abstraction Decisions

Abstraction is used in the Food Delivery System to hide complex implementation details and show only essential features to the users. For example, customers can place orders and make payments without knowing how these processes work internally. The system provides simple methods such as `placeOrder()` and `processPayment()` to perform these operations. This makes the system easier to use, understand, and maintain.

---

4. Invented Software Object

An **invented software object** for the Food Delivery System could be **OrderTracker**. It tracks an order's progress from placement to delivery and updates its status, such as *Pending*, *Preparing*, *Out for Delivery*, and *Delivered*. It helps customers monitor their orders and makes order management easier.
